

In 2009, Superior Crop Products (SCP) discovered certain chemicals were very prevalent in SCP's test field located in Northwest Iowa. An initial soil sample was collected in January 2010 and sent to Columbia Food Laboratories, Inc. in Corbett, Oregon. Their testing revealed the levels of glyphosate and AMPA present in the soil.

MaxRelease 450 was applied in response to their findings. By August 2010, there was a marked reduction in glyphosate and AMPA levels. *MaxRelease 450* has been repeatedly applied with the same reduced chemical levels as first observed.

The line graph below portrays the glyphosate and AMPA trends over the years. Have you tested your soil lately to see what levels exist?
